FotoStation PRO Clinical Edition has been designed for people who work professionally with digital pictures within the healthcare industry. It puts you in command whether you have just started building an archive, or need a fast, powerful solution to organize your existing one. FotoStation PRO Clinical Edition offers powerful workgroup collaboration tools, and adapts perfectly to even the most complex workflow requirements.

Integrated ICD-10 library

The ICD-10 (International Classification of Diseases) library integrated in the text editor facilitates your text processing. The library function also works as quality assurance with regards to correct spelling. Uniform spelling is of vital importance for later retrieval of stored information.

MeSH support

FotoStation PRO Clinical Edition offers an import function for MeSH (Medical Subject Headings). MeSH can, just like ICD-10, be used as an encyclopedia when texting, categorizing and searching amongst frequently used clinical terms.

Merge your pictures and Patient Record System

With FotoStation PRO Clinical Edition you can automatically synchronize metadata in your pictures with your patient records using an ODBC connection. ODBC enables you to interact with relevant databases like Microsoft SQL Server, Oracle, Sybase etc.

Data Mining

Data Mining is the quick and intelligent way of finding your images without the need to formulate a search for them. With a 'Word list' approach you can find all images with the same content in a selected text field (IPTC). Just click on for instance 'Keywords', and view all pictures containing the same keyword. The 'Calendar' approach allows you to easily view by calendar dates or range of dates.

Highly customizable interface

FotoStation PRO Clinical Edition has been made with customization in mind. Group and organize your archives on side panels, tweak the text editor layout to suit your needs, and create custom views to organize your files – your way. Sort files by attributes, image similarity or text content, or make a custom arrangement by dragging and dropping files in whichever order you please.

Process oriented

Actions allow you to carry out a host of operations at the click of a button. Configure an action to apply a text template, resize images to fit a certain layout, upload files to a web server, or choose from a number of other available options. Several processes can be carried out in sequence to help automate your workflow.

Advanced searching and retrieval

FotoStation PRO Clinical Edition features a powerful search tool that lets you perform advanced, multi-archive searches where you can specify file attributes and additional search options to narrow the search.

Archive maintenance is made possible through 'search and replace' functions and database connection to update the text in your archived files.

Scalability

For very large archives FotoStation PRO Clinical Edition can be connected to FotoWare Index Manager, a server application, which can handle hundreds of thousands of files without compromising search speed.

Tailor made text editor

The FotoStation PRO Clinical Edition text editor has been tailor made for the clinical market. It can be customized to include exactly the fields you require. The text editor's layout and available fields also change depending on the type of file being captioned. The text editor can also make use of the auto-complete and spell-checking capabilities of Microsoft® Office.

Handling of digital camera files

Acquire files from any media, and store directly in an archive. You can process the file by using an action, for instance to convert raw format files from a digital camera to an industry standard format such as TIFF, JPEG or EPS.

Projects

Create collections of files using projects! Files from different locations can be collected in projects and shared with other users on the network. Flags allow you to set a visual indication of a project's status, and you may also add a suitable project description.

Offline Storage

Insert a CD-ROM and let FotoStation PRO Clinical Edition index its contents. You may archive the contents of any type of removable media. The offline archive is fully searchable, and FotoStation PRO Clinical Edition will prompt users to retrieve the correct media when the original file is required.

Printing

FotoStation PRO Clinical Edition provides a number of predefined print templates, and you may create your own to incorporate a logo and layout. You can also get FotoStation PRO Clinical Edition to create a layout for you automatically by simply selecting a number of images and choosing the required number of rows and columns.

Image Editing

Use FotoStation PRO Clinical Edition to easily correct the color balance in your images! In Edit mode you will find several tools similar to those found in Adobe PhotoShop®, such as hue and saturation settings, curves, manual color balance adjustment and automatic setting of white and black points. Image Actions let you configure a number of operations that can be carried out automatically, for instance to perform automatic color balancing, contrast adjustment etc.

True tissue colors

FotoStation PRO Clinical Edition has fully integrated Color Management. Use ICC profiles to ensure correct display of thumbnails and previews in your archive. Using an action you can tag an image with a profile to ensure correct rendering of colors.

Drag and Drop

FotoStation PRO Clinical Edition makes extensive use of drag and drop. Use it to organize your archives and actions within the program, or to drop files to an external program. Using the Crop and Drop feature you can instantly crop an image when you drop it into a program such as Microsoft Word or PowerPoint.

Text record import and export

Using FotoStation PRO Clinical Edition you can export and import text to your files in any format. Support for formats used by other major software manufacturers is built in and makes text record import and export a swift operation. You can even create your own format to comply with any proprietary system.
